

Pool timer with web interface, external connections

The voltage for the relay coil depends on the supply voltage (RAWDC) used to power the board. Use a 5V-6V relay and add resistor R_r if the supply voltage is higher than 6.5V.

Example:
 5-6.5V $R_r=0$, 7-9V $R_r=47$ Ohm,
 10-12V $R_r=68$ Ohm

The exact value depends on the type of relay. Try different values between 22 Ohm and 150 Ohm.
